

README

I did my Bison Tiny Basic Parser on a Windows machine with Cygwin.

Although the assignment description states that a Carriage Return is `\n\r` on Windows, in my Cygwin, a `<Enter>` key results in a new line. (a single `\n`)

Thus, I defined the CR token as a single `\n` in my flex file, and accordingly only used single `\n` for new lines in my Tiny Basic Program “test”.

Both stdin input parses and redirect file parses were successfully on my machine.

I figured I’d mention it since I’m not completely sure what the behavior would be in a different environment.

Thank you!
